Coloured surface hardeners are an intergrind of pigments, cement and silica aggregate and include a surface conditioning additive.

The colours shown are a representation of the finished product, for more accurate colour matching, please check with sample chips. Colour chip boxes are available from our Colchester and Sheffield colour centres.

The colours shown on this chart match as close as possible to the appearance of coloured surface hardeners applied onto troweled or imprinted concrete. Final colour is dependant on finishing techniques, correct application and sealant. Also, release agents will affect the colour by creating an antiquing effect. If in any doubt, it is advisable to produce a sample prior to installation.
